## **The SMLX Airbrator®**

We are pleased to announce SMLX's new, disposable Airbrator® which, according to certain authorities in the industry, is destined to have a positive impact on dental practices.

Wouldn't it be nice if a visit to the dentist's office was no more traumatic than a visit to the barbershop? If all procedures could be done using air abrasion technology, that would be the case, but we know that is not possible.

However, there are many procedures that can be done using air abrasion technology. People are starting to be being educated as to the advantages of air abrasion, as dentist's are turning more and more to using air abrasion as a "patient builder". Air abrasion eliminates the fear of the needle, particularly in children, who are also fearful of the noise and heat of the drill.

If air abrasion is a true "patient builder", it follows that a dentist who does not use air abrasion is going to lose patients.

The \$64 dollar question for the dentist, is what type of air abrasion unit to use, as he now has a choice he never had before.

Previously, a dentist wanting to use air abrasion had to make a rather large capital outlay for a major piece of equipment. If there were more than one dentist in an office, they had to move their patients to the machine, rather than being able to use the machine at their chair. The abrasives used in the machine had to be changed by hand; the probes had to be sterilized and the abrasives changed by hand, both which introduced a chance of contamination; and the machines had to be maintained.

Now, with the introduction of SMLX's inexpensive, disposable, Airbrator®, there is no capital outlay required, so there can be an Airbrator® at every chair in a dental office; there is nothing to sterilize or fill, so there is no contamination problem; nor are there any maintenance chores. Use the Airbrator® once and throw it away – what could be simpler and more cost effective!!!

Here's to needleless denistry,
